1. Product Summary

Tired of dealing with strangers? Use Gator Trader!

Are you a busy San Francisco State University student? Then we have an awesome new app that is going to help you purchase and sell goods online to nearby students just like you! Gator Trader was specifically designed by an outstanding crew of engineers to help SFSU students with their needs. Our application is user friendly, sophisticated, and super convenient. Only SFSU students now have the advantage to post, view, and message each other via our website making transactions simple so you can kiss that moving truck goodbye. Dealing with local students doesn't just make our product unique, but also an accomodation to you. Visit our page at

<http://gatortrader.herokuapp.com/>

Thanks for looking :)

1.1 Functional Commitments

1. Guest users shall be able to browse through the website.
2. Guest users shall be able to browse by categories.
3. Guest users shall be able to search on the search engine.
4. All users who wants to purchase an item shall create an account.
5. Registered users shall be able to contact any sellers.
6. All users shall be presented the Policy while they're creating their account.
7. Registered users shall include contact information.
8. Registered users shall be able to look at the lists of the items they posted for sell.
9. Registered users shall able to manage their account. Shall able to remove or edit postings.
10. Guest users shall be able to use sorted feature: Low to high prices, High to low prices, Alphabetical.

2. Usability Test Plan

2.1 Test Objectives:

- Post ad with Tagged Image File format (.tif) image using Windows 10 on the latest Internet Explorer Browser.
- Post ad with Graphics Interchange Format (.gif) image using Windows 10 on the latest Mozilla Firefox Browser.
- Post ad with Joint Photographic Experts Group (.jpg) image using Windows 10 on the latest Opera Browser.
- Post ad with Portable Network Graphics Image (.png) image using Windows 10 on the latest Google Chrome Browser.
- Post ad with Tagged Image File format (.tif) image using Mac OS High Sierra on the latest Google Chrome Browser.
- Post ad with Graphics Interchange Format (.gif) image using Mac OS High Sierra on the latest Opera Browser.
- Post ad with Joint Photographic Experts Group (.jpg) image using Mac OS High Sierra on the latest Mozilla Firefox Browser.
- Post ad with Portable Network Graphics Image (.png) image using Mac OS High Sierra the latest Internet Explorer Browser.

2.2 Test Plan

For the useability test portion we chose the Upload Image function to be thoroughly tested. The plan it to try two operating systems: Windows 10 version 1809 and Mac OS High Sierra Version 10.13.6. In conjunction 4 different popular web browsers will be used at a random order desired by the technician which are stated to be Firefox Version 70.0 Nightly, Google Chrome Version 70.0.3538.110, Opera Version 57.0.3098.76. Internet Explorer Version 11.

The starting point will be <http://gatortrader.herokuapp.com/> which is the home page. The intended user is a qualified Q&A personnel who is also a student. They shall navigate to the top left corner where the gray “Sell” button is and click it. Assuming they have not created an account the user will be prompted to register. User will have to input their First Name, Last Name, SFSU

Student ID, Username, and Password. Then click on the Green Box below named "Register" and they will be redirected to the posting page. Here the user will input their Username, the Item they are selling, a Description, the Price, the Category of the item being sold, and a upload box at the very bottom that will allow the user to browse their device and select an image to go along with the post. The user will create 4 ads with a Windows Machine and 4 ads with a Macintosh. The purpose of this is to test the limits of common image file formats to see if they are compatible with the application being tested. The three most common formats widely used that's expected to pass will be Joint Photographic Experts Group (.jpg), Graphics Interchange Format (.gif) and Portable Network Graphics Image (.png). While white elephant in the room that's expected to fail will be Tagged Image File Format (.tif), this format is widely used but its not as common. The user will create the 4 different ads with the 4 different file formats then switch the operating system and go to the same home webpage but this time just navigate to the "Login | Reg" tab to the left of the "Sell" tab where the user can simply log on with their existing username and password on the left hand side of the page and continue posting. For testing purposes user will be responsible for acquiring the proper format images with the proper licenses via google search. It it solely up to the user to follow the criteria to test the individual web browsers in any order they wish to.

2.3 Questionnaire

| | Strongly Agree | Agree | Neutral | Disagree | Strongly Disagree |
|--|-----------------------|--------------|----------------|-----------------|--------------------------|
| The test plan was simple to read and follow | | | | | |
| The application was simple to navigate | | | | | |
| This was a throw Test Plan | | | | | |
| How could you improve this test plan? | | | | | |

3. QA Test Plan

3.1 Test Objectives

The objective is to test thoroughly the upload function of GatorTrader in order to ensure that upload results are fully functional and display the image on the posting page. Detailed information referred from section 2.2.

3.2 System Setup

Processor: Intel Quad Core i7
Ram: 16GB Ram
Operating System: Mac OS X High Sierra
Browser 1: Google Chrome
Browser 2: Mozilla Firefox
Browser 3: Internet Explorer
Browser 4: Opera
URL: <http://gatortrader.herokuapp.com/>

3.3 Feature to be Tested

This QA test will prove the functionality of the upload function from GatorTrader's major page: Sell. The test will account for the following expected functionality:

- The upload button shall integrate with most web browsers and operating systems to be functional in a way to retrieve images files stored on the device.
- At least 3 image file extensions shall be able to upload to the database.
- All images uploaded shall be shown on the ad posted listing.

3.4 Test Cases

The test cases are as followed: 4 different web browsers, 2 different operating systems, but most importantly are the 4 individual image format files. More detailed information seen on section 2.2 .

3.5 Test Results

The test results are as followed: All 4 browsers along with both operating systems loaded the pages and uploaded the images accordingly. All expected image format files succeeded the upload and were seen on the individual ads posted. The only format that failed was Tagged Image File format (.tif) that succeeded the upload but failed to be seen on the ad posting with the error message “Card Image Cap”. This was expected and is completely normal for the operation conducted. Thus concluding these results and moving foward.

3.6 QA TABLE

| | .jpg | .png | | .gif | .tif | |
|--------------|------|------|-------------------|------|------|------------|
| Macintosh OS | ✓ | | Opera | ✓ | | Windows 10 |
| Macintosh OS | ✓ | | Mozilla Firefox | ✓ | | Windows 10 |
| Macintosh OS | | ✓ | Internet Explorer | | X | Windows 10 |
| Macintosh OS | | ✓ | Google Chrome | | X | Windows 10 |

✓ = Pass on Windows 10

✓ = Pass on Macintosh OS

X = Fail on Windows 10

X = Fail on Macintosh OS

4. Code Review:

4.1 Coding Style

We opted to use several standards while developing this application. For our naming conventions, we decided to use meaningful names for our identifiers, and classes. Since our project is written completely in Javascript we are implementing the ES6 standard, enforced by ESLint.

4.2 Review

This code review is a sample of our internal code review process. The code reviewed was the back-end of the login function. Below are the conversation exchange through GitHub and code snippet relevant to the review.

Looks good. Thanks for fixing this. Frontend needs to go through the codebase and add Header comments at some point.

HellocsWorld 39 minutes ago

sure, I have used axios for getting the data from backend. axios is very simple to use and it has more features than fetch.

marcusmertilien 7 minutes ago

Is there a reason we switched from Fetch to Axios?

almondjoys 4 minutes ago

i think switching to axios is fine but we should share the knowledge between front end so we know what is going on

5) Self-check on best practices for security

5.1 Major Assets Being Protected

The following user information is being protected:

- Name
- Password
- Email address
- Listing address

5.2 Encryption of Passwords in the Database

The screenshot shows the MySQL Workbench interface. The query editor at the top contains the SQL statement: `SELECT * FROM users_database.user_info;`. The result grid below displays the following data:

| first_name | last_name | student_id | userName | user_password |
|--------------|-----------|------------|-------------|---|
| alex | ha | 1234567 | alexha | \$2a\$10\$erlAp3bAvVqG7kUqnoX.gW1plBC0zl... |
| Alex | Ha | 1234 | alexha415 | \$2a\$10\$e39ZorV8sZQT3P99c1n9eXaUHa2twn... |
| Raul | Serrano | 16284 | Anton | \$2a\$10\$5WUln3Indw85eZ8V6GPz.pnaDZSsa... |
| anton | hernandez | 123455 | blackheart | \$2a\$10\$6YmVwlvq7jhdQA.Y7.AHTOjaMuugR3... |
| Raul | Serrano | 12345 | blueheart | \$2a\$10\$ssm0WCu634c9Ug0iVYZwUg1GcV... |
| Jonh the 3rd | Sacarias | 12345555 | greatScotch | \$2a\$10\$RY4538k8hQz0bFk8B1.OwdH86Op... |
| joni | jose | 12345533 | greenheart | \$2a\$10\$3v4NQK0Gbz.7z0QK8FuYLSjhtqSF... |
| tester | padilla | 12345532 | yellowheart | \$2a\$10\$BxsWgPdKzTCgxvBJ35Kr.K7UNFa0... |
| NULL | NULL | NULL | NULL | NULL |

The interface also shows the left sidebar with navigation options like Server Status, Client Connections, and Schemas. The bottom panel shows the query execution log with the following entry:

| Time | Action | Response | Duration / Fetch Time |
|----------|--|-------------------|------------------------|
| 22:20:29 | SELECT * FROM users_database.user_info LIMIT 0, 1000 | 8 row(s) returned | 0.066 sec / 0.00002... |

5.3 Input Data Validation

The following user input is checked for validation on the front-end by built in html validation and bootstrap for registration, login and posting.

Listing details:

- Price
- Description
- Name of the item

Search query input:

- For example, if a user attempts to search “jgdfuhdkghdlfghlikhsgkhgkjehrkfghierkhekrhgerhtkjerhjerbjerjthbjerbtjerb”, the field will only take up to 40 characters.

6) Self-check: Adherence to original Non-functional specs

| | Non-Functional Spec | Status |
|----|---|----------|
| 1. | Application shall be developed using React, Heroku, Express, MySQL. | DONE |
| 2. | Application shall be designed for desktop and laptops. The browsers that support it are Chrome, Mozilla, and Safari. | DONE |
| 3. | Application shall render well on mobile | ON TRACK |
| 4. | Data will be stored on MySQL. | DONE |
| 5. | No more than 50 users can access the website at a time. | ON TRACK |

| | | |
|-----|---|----------|
| 6. | Privacy of users shall be protected and all privacy policies will be appropriately communicated to the users. | ON TRACK |
| 7. | The language used shall be English. | DONE |
| 8. | Application shall be very easy to use. | DONE |
| 9. | Google analytics shall be added | ON TRACK |
| 10. | No E-mail clients shall be allowed | DONE |
| 11. | No pay functionality only messages. | DONE |
| 11. | The website will display “SFSU-Fulda Software Engineering Project CSC 648-848, Fall 2018. For Demonstration Only” at the top of the page. | ON TRACK |
